BumpCast: nervous flyers (creative brief)

BumpCast is an iPhone app that forecasts turbulence for your exact flight. You add your flight number, and it tells you in plain words when the bumps will come, how strong they'll be and when they'll end. It's built for nervous flyers and covers flights in the continental US and southern Canada.

We're looking for creators who've felt nervous about flying, now or in the past, to make short videos we'll run as ads on Instagram and Facebook. Flying soon? Even better: we want to see the forecast next to what your flight really felt like.

What you get

- CA$10 for each approved video (up to 3 if you're flying, 2 if not).
- 10% of everything we spend running your video as an ad. The better your video does, the more we spend on it, and the more you earn.
- 3 months of BumpCast Pro, free. It doesn't renew, so you're never charged.
- We may run your video as a partnership ad from your Instagram handle.

Who we're looking for

- 18 or older, in the US or Canada, with an iPhone.
- You've felt nervous about flying. It doesn't need to be extreme, but it does need to be true.
- Comfortable talking to camera.
- Ideally, a flight booked before Dec 31 within the continental US or southern Canada (not Hawaii, Alaska, Mexico or international). If you're flying in the next two weeks, we'll accept you first.

When you join, tell us: where you live (state or province), and your soonest flight with date, airline, flight number and route (for example, "Nov 6, Delta DL 1234, Atlanta to Denver"). No flight booked? Just say so.

Rules for every video

Delivery

- Vertical 9:16, 1080p or higher, 15 to 45 seconds.
- Upload the original file from your camera roll. No TikTok or Instagram watermark, no stickers, no burned-in captions or music. We add text and captions in the ad, so leave room at the top and bottom.
- Record the hook three ways (three different first lines) and upload them together, so we can test which one works best.
- Clear sound: face the camera, somewhere quiet, unless you're on the plane.

Always

- Say the name clearly: **BumpCast**.

- Use real forecasts from the app, from your own flight or another real upcoming flight. Screen-record them yourself.
- Keep it calm. BumpCast's whole point is that turbulence is normal and can be forecast. Funny and honest are great. Scary isn't.
- If you also post the video on your own accounts after it's approved, mark it as a paid partnership and add #ad.

Never

- Say BumpCast keeps you safe, predicts every bump or is always right. It's for comfort and planning.
- Say it treats or cures anxiety or fear of flying. Your own experience ("it helps me feel calmer") is fine if it's true.
- Use scary edits: screams, alarm sounds, crash or emergency footage.
- Use footage of real incidents or injured people.
- Fake or exaggerate turbulence, or film on the ground as if you were in the air.
- Film flight attendants or other passengers' faces.
- Unbuckle, stand up or ignore the crew to get a shot.
- Mention or criticize other apps or airlines.
- Post the video anywhere before we approve it.

Things you can say about BumpCast

- "It forecasts turbulence along your exact route, minute by minute."
- "It tells you when the bumps start, how strong they'll be and when they end."
- "The forecast comes 48 hours before departure, and it updates 24, 6 and 2 hours out."
- "It works in airplane mode, because the forecast is saved on your phone before you board."
- "There's a Lock Screen countdown to the next bumpy stretch."
- "It has guided breathing timed to the next bumpy stretch."
- "It's free to try, for flights in the continental US and southern Canada."

Brief 1: Talk about it (everyone)

The idea: a 20 to 40 second talking-head video about flying as a nervous flyer, with BumpCast as the thing that helps. Unlike an organic post, this one is an ad, so BumpCast is the point, not a side mention. It still has to sound like you.

Shape

1. Hook (first 2 seconds): one of the hooks below, or your own. Record three.
2. The feeling: one honest line about what flying is like for you.
3. BumpCast: show your phone, or cut to your screen recording of a real forecast (grade, then the timeline). Say what it showed: "A few bumps around 40 minutes in, then smooth to landing."
4. Why it helps: knowing when the bumps come, and when they end.

5. Close: "It's called BumpCast. Check your flight before you fly."

Angles (pick one per video)

- **The night before:** your pre-flight routine, with BumpCast as the step that settles you.
- **Tips:** two or three honest nervous-flyer tips, with BumpCast as the main one.
- **Flying home for the holidays (due by Nov 13):** checking your Thanksgiving or holiday flight. Canadian creators: say "flying home for the holidays".
- **Turbulence in the news (only when we message you):** see below.

Hooks

- "If you hate turbulence, do this the night before you fly."
- "I used to spend the whole flight waiting for the bumps. Now I know when they're coming."
- "Nervous flyer here. This is the app I check before every flight."
- "Flying home for Thanksgiving and dreading the turbulence?"
- "Me checking whether my holiday flight will be bumpy."

Getting the screen recording: add any real flight leaving in the next 48 hours (yours, or one on a route you fly) and record its forecast.

When turbulence is in the news

We'll message you the story link and the facts. Upload within 24 hours if you can.

1. Hook: "You've probably seen the turbulence story. As a nervous flyer, here's what helps me."
2. One or two calm facts from our message or the list below. Don't guess at causes or add details that weren't reported.
3. "Turbulence is weather, and weather can be forecast. I check my flights on BumpCast before I fly."
4. "And keep your seatbelt on whenever you're seated."

Calm facts you can use:

- The most common bumps at cruise come from fast winds next to slower air, and planes are built for far more than that.
- Bumps over mountains follow the terrain and usually pass once you're beyond them. Crews plan their altitudes around them.
- Crews ask you to keep your seatbelt fastened whenever you're seated, and that's the best protection there is.

Never say BumpCast would have predicted that flight, show the news footage itself, joke about the incident, or blame the airline.

Brief 2: On the flight (flyers)

The idea: BumpCast told you when the bumps would come. Show the forecast, then show the moment it happened.

When: upload within 3 days of landing. One video per flight, up to 2 flights.

Before you fly

- Add your flight in BumpCast. The forecast appears 48 hours before departure.
- The night before, screen-record the forecast: the grade (for example, "A few bumps"), then scroll the timeline to the bumpy stretch. Record it again at the gate.
- Check that Live Activities are on for BumpCast (Settings → BumpCast → Live Activities), so the countdown shows on your Lock Screen.

On the flight (seatbelt on the whole time)

- After takeoff, if the countdown hasn't started, tap "We've taken off" in the app.
- Film your Lock Screen when it shows the next stretch, like "Next: light chop in about 6 min".
- When the stretch arrives, film something calm that shows it: a drink on the tray table, the wing out the window, the seatbelt sign coming on.
- Film again once it's smooth.
- After landing, rate the flight in the app.

Shot list (20 to 45 seconds)

1. 0 to 2 seconds: the hook, to camera or over the window. Record three.
2. The forecast screen recording: grade, then timeline.
3. The Lock Screen countdown in the air.
4. The bumps (drink, wing or seatbelt sign).
5. Smooth again, plus your reaction.
6. Optional: the rating screen after landing.

Upload the clips as one edited video **and** the separate raw clips, so we can cut more versions.

Hooks

- "This app told me exactly when the turbulence would start."
- "It said light chop in 6 minutes. Watch."
- "Nervous flyer test: does a turbulence forecast actually work?"
- "I knew the bumps were coming minutes before they did."
- "My flight home: forecast vs. reality."

If the forecast was off: don't upload the comparison, and don't fake it. Rate the flight in the app, make a Talk about it video instead, and tell us how it went.

Usage rights

BumpCast keeps a perpetual license to each approved video once its flat fee is paid; the commission is extra pay, not a condition of the license. You keep the right to show your videos in your own portfolio.
